

NAVAL CONTROL VALVES DN 15 - 200 :

The valve is designed to be used as a control and shut-off valve.

Installation:

The pipeline has to be equipped with a necessary number of mud traps to prohibit solid matters from getting into the pipeline and further into the valve.

The flow direction must be taken into account during the installation. Flow direction has been marked on the valve with an arrow ®. The red measurement fitting is before the shut-off and the blue one after the shut-off in flow direction.

Further, it is necessary to avoid installing the valve in a direct connection with a pump or any other pipeline armatures.

The picture demonstrates some instructional installation distances of control valves from pipeline armatures.
